Gas sensor moduls

The gas sensor modules contain the additional technology required for sensor ICs (voltage regulation, pull-up resistors,...) and the connection pins simplify the connection of the sensors to, for example,

Arduinos. The modules are typically universal and can be used for several sensors, so it's worth paying attention to which sensor is installed on the module, mainly because of the power supply (almost all sensors work with 3.3V, but not all of them work with 5V). There are often bridges used for addressing on the modules, which can be soldered in and out, and for example I²C addresses can be set with them.

Software example

The easiest way to find the example program for the current sensor is in the Arduino program in the "Library Manager".

Example to MQ-3 sensor to Arduino Uno

Arduino pin	Modul pin	Description
5 V	Vin	power supply can be 5V
GND	GND	-
D2	DO	Digital (alarm) signal from modul
A5	AO	Analog measuring value (0..5V)
